

AI Foundry

Changing the Way Organizations Think About Data

Helping Organizations on their Digital Transformation Journey

AI Foundry, a Kodak Alaris business unit, transforms enterprise operations by integrating information, people and processes to enable increased insight and improved decision-making. Our Actionable Intelligence Management solutions help organizations streamline and automate manual processes, seize new business opportunities and manage compliance, all while driving bottom-line performance.

Our team provides both the solutions and expertise to accelerate an organization's digital transformation journey.

Our mission is to put your data to work, so that you can extract the most value from it every day.

We are inspired by the belief that people and departments can find better ways to work with data and make their data "actionable". This results in organizations being better positioned to compete in our new-age digital economy. Our Actionable Intelligence Management solutions enhance data and documents organizations receive day in and day out, while extracting business value from historical documents, which contain dark data. We help transform this unknown information into Actionable Intelligence to fuel digital transformation, which enables organizations to align business processes with measurable outcomes.

Actionable Intelligence Lifecycle

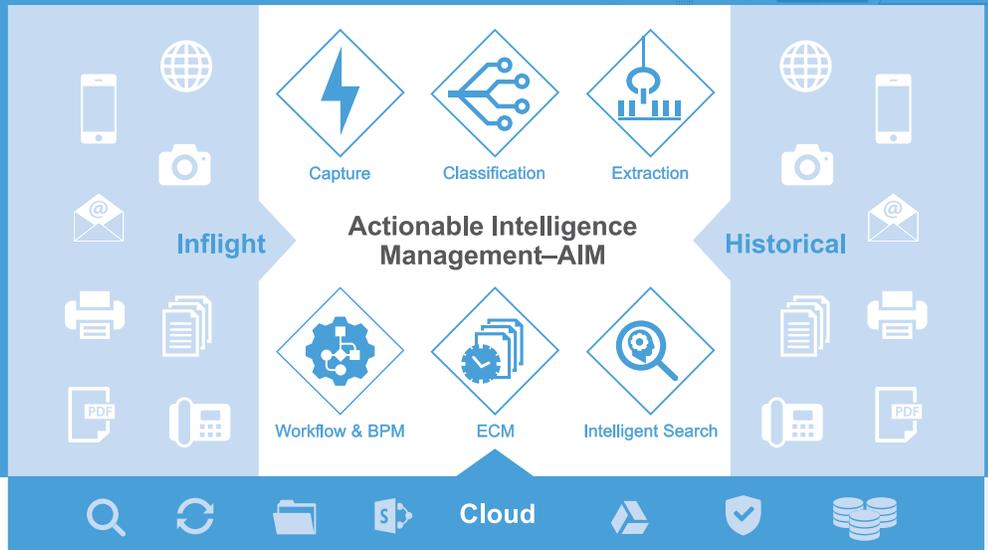

AI Foundry's Actionable Intelligence Lifecycle is a process that scales beyond a single document or ECM system, to an enterprise-wide way to deal with a large variety of different repositories and systems that manage individual documents. By being able to apply the lifecycle to these varying systems, the enterprise has a common methodology to deal with their documents, and to ultimately migrate to a single system and process.

Actionable Intelligence Management

Actionable Intelligence Management enables organizations to take control of data flowing into organizations, as well as, data sitting in repositories, file shares, Cloud drives, etc. AIM fuels digital transformation with enhanced document capture, classification, data extraction, business process management, information governance and intelligent search for structured and unstructured content. AIM solutions take inflight data—web forms, emails, attachments, and paper scans—as well as, historical documents hidden in file shares, ECM repositories, SANs, computers and makes them operational.

The Actionable Intelligence Management platform helps organizations not only identify and make sense of their fast-growing library of unstructured data captured by systems and applications, but also speeds up time to value to by linking key functions in a holistic, end-to-end solution.

Scenarios

Actionable Intelligence Management solutions from AI Foundry empowers organizations to streamline processes and help employees make informed business decisions. Some examples of where AIM Solutions can help:

- Mortgage and loan process automation
- Customer/account onboarding and administration
- Claims automation
- Contract and document management
- Cloud/Data migrations
- Uncovering dark data
- Searchable knowledge

Key components include:

Capture

Capture is the on-ramp to your digital transformation journey. Organizations have a vast amount of documents in a variety of different types coming into your organization from customers, partners, suppliers and many other sources. These documents need to be connected to a business process so that they can be properly handled. Capture is the way that is done. Whether a paper document that needs to be scanned or a digital document that needs to be recognized, each of these must be taken in, saved, and properly dispatched. Getting this initial step done correctly is key to efficiency in the rest of the cycle.

Classification

Once the data has been captured, information must be classified into the proper type of document, such as, a mortgage, invoice, or onboarding form. The end result of classification is that documents can more easily be retrieved, shared, edited and stored, while reducing risk and compliance issues associated with personal, confidential or financial information.

Extraction

After documents are classified, data can be extracted to feed workflows, populate databases, and provide context-specific insights to business processes. In this phase of Actionable Intelligence Management, metadata is also generated to further enrich the data.

Workflow

Actionable Intelligence is often facilitated by the workflow representation of an entire end-to-end business process, typically just a single click away.

Enterprise Content Management

As part of a holistic solution, ECM allows complex data to be a more transparent asset that can be used by business users across the enterprise. ECM is essential to unlocking the power of data, regardless of its document source, in order to create actionable intelligence.

Intelligent Search

A flexible and robust Actionable Intelligence Management platform uses full text search functionality to mine text-based and/or image-based documents in conjunction with multi-faceted search—where users can search by a hierarchy of categories. This combination creates an intuitive end-user experience coupled with speed and accuracy.
